

THALASSEMIA panel

For the screening of variants causing alpha and beta thalassemia

The THALASSEMIA panel is a **CE-IVD amplicon-based kit** designed for the efficient detection of the most common variants associated with α - and β -thalassemia in a single workflow.

It targets the HBA1, HBA2, and HBB genes and enables identification of SNVs, small indels, and large exon-spanning CNVs through **Next Generation Sequencing (NGS)**.

The kit is validated for use with DNA extracted from blood samples.

4bases THALASSEMIA panel allows for **precise, reliable, and effective results, speeding up** the activity of clinical reporting.

From DNA to sequencing in less than 1,5 days with less than 2 hours hands-on time.
